How Your Metabolism Can Make You Lose Weight Even When You Eat More

These little-known secret facts about your metabolism, when left way out in the dark... could be your biggest fat loss ally.

Please be warned: a toxic and mad of the way through this...

If you do that you'll understand some of the science behind your metabolism, and in the end, will fully empower you, RIGHT? Okay, let's do it!

But not! Sorry. I will make everything I discuss here clear for you, so you won't need a PhD to understand this.

YOUR METABOLISM REVEALED

Do you remember hearing the word "Homeostasis" in school?

BASICALLY IT MEANS "BALANCE" - YOUR BODY IS ALWAYS TRYING TO STAY BALANCED IN MANY DIFFERENT WAYS.

A person's body temperature is balanced at 37.4 degrees Fahrenheit. During exercise or strenuous activity, your body temperature begins to rise. That's when our amazing bodies begin to help.

As your body temperature reaches just 99 degrees, you'll begin to sweat, releasing heat. During strenuous exercise, your body loses 4% of its fluid and 20% of energy! You even release some heat through your breathing.

Imagine what would happen if your body temperature didn't maintain this balance. At a body temperature of just 104 degrees, we are susceptible to a heat stroke. Heat exhaustion is less severe and more common, but both are forms of a heat stroke that

This is just a natural process that your body uses to keep itself balanced.

Your body even releases chemicals that make you shiver your body temperature to be low, producing an amazing amount of body heat!

But there are processes to keep you balanced in all sorts of things... Calcium, blood pressure, pH levels, and so much more!

The point is that your body needs to maintain a balance to work properly, and it's extremely important.

But what does this have to do with losing weight?

Everything! You see, just like your body temperature to naturally balanced...

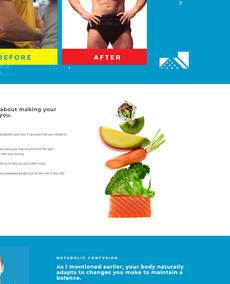
Your body has a process for balancing your weight.

Many people today, especially women, have learned to low calorie diets for long periods of time in an effort to lose weight.

The usually works at first... but soon the yearly visits and the weight return coming off... or even worse, they begin to GAIN weight while eating the same amount of food.

When this happens, most begin to think their problem is with their genes, and they just weren't lucky enough to be born with good ones... They're armed with slow metabolism and there something they just have to live with... But that's the furthest thing from the truth!

So why does this happen so often?



METABOLIC SUPPRESSION

Metabolism is how your body turns food into energy.

Your body NEEDS food to produce energy. If it doesn't have enough food, it can also use stored fat to produce energy. But if it doesn't have enough food or fat, you'll die!

So, the reason you stop losing weight on low calorie diets because your body hates starvation.

On many of the common diets today, you don't get enough calories from your food. Your body responds BY INCREASING FAT to protect itself from starvation.

Low calorie and especially low carb diets can make you retain fat at an extremely high rate.

You see, of course, continue to eat less even at this point... But as you continue to burn through fat but you are burning more and more to what starvation.

At this point almost everyone goes to the extreme hunger and they begin to binge eat on everything they can find.

That's why these extreme diets are very bad for you. Not only do they damage your body depriving it of vital nutrients, but they are also unsustainable... You can't live like that for long and be normal life.

This causes your dieting from extreme over-eating to over-eating. Needless to say those fluctuations in weight, nutrition, hormones, and so much more is VERY HARM on your body.

And over time this lack of consistency slows down the metabolism. This is the natural process for it to follow since it doesn't know if it's going to get much food tomorrow or not.

You see, your genes do not cause this. It's all about your diet.

The process of slowing down your metabolism is called Metabolic Suppression, and that is the problem.

The Thermal Effect of Food

Your body NEEDS food to produce energy. If it doesn't have enough food, it can also use stored fat to produce energy. But if it doesn't have enough food or fat, you'll die!

So, the reason you stop losing weight on low calorie diets because your body hates starvation.

On many of the common diets today, you don't get enough calories from your food. Your body responds BY INCREASING FAT to protect itself from starvation.

Low calorie and especially low carb diets can make you retain fat at an extremely high rate.

You see, of course, continue to eat less even at this point... But as you continue to burn through fat but you are burning more and more to what starvation.

At this point almost everyone goes to the extreme hunger and they begin to binge eat on everything they can find.

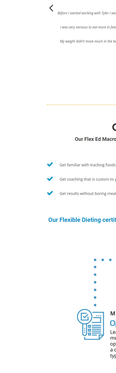
That's why these extreme diets are very bad for you. Not only do they damage your body depriving it of vital nutrients, but they are also unsustainable... You can't live like that for long and be a normal life.

This causes your dieting from extreme over-eating to over-eating. Needless to say those fluctuations in weight, nutrition, hormones, and so much more is VERY HARM on your body.

And over time this lack of consistency slows down the metabolism. This is the natural process for it to follow since it doesn't know if it's going to get much food tomorrow or not.

You see, your genes do not cause this. It's all about your diet.

The process of slowing down your metabolism is called Metabolic Suppression, and that is the problem.



MACRONUTRIENTS

Your diet consists of a combination of Proteins, Carbohydrates, and Fats. These are called Macronutrients.

When you eat proteins, your body can use up to 30% of the calories just to digest that. Fats, in comparison, burn some what around 3% during digestion.

So, eating 100 grams of protein after digestion as the eating 100 grams or about 400 calories.

Eat that same amount of fats and you are missing over 1,000 calories! That's over 3 times the calories!

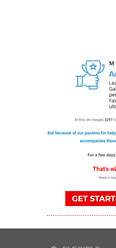
So protein can be an enjoyable and pain-free part of your diet. Especially because it plays a key role in keeping you from feeling hungry.

But I'm not saying we need an all protein diet!

Fats are also important. They protect our organs and store energy. They also help your immune system, hormone production, and burn off other stuff. They are important and need to be consumed in moderation.

Now carbs can't be ignored either. They are your body's primary source of ENERGY. That's why low carb diets make you tired and unable to focus on your workouts.

According to my Harvard study, 60 minutes of aerobic activity will burn about 260 calories for a 155 pound person.



With a proper combination of macros, however, you'll burn twice that! JUST BY EATING!

And it's you can burn more, you can eat more... AND STILL LOSE WEIGHT!!!

And, on top of all of this, you'll actually have energy!

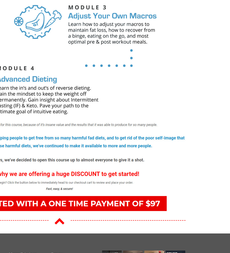
That means you'll feel much better. But also, if you want to incorporate exercise into your life to burn more calories...

You'll realistically start a lot more than you would when your body is fighting against you to retain its energy.

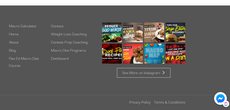
Do you see the picture?

A higher metabolism, more burning through digestion, and more energy to burn during exercise...

All of this adds up to burning 10-20% more calories EVERY DAY.



TRANSFORMATION



FLEXIBLE DIETING

Flexible Dieting is all about making your metabolism work for you.

I hope this has really helped you to understand metabolism and how it can work FOR you instead of against you...

If you've used up many calories, you should now have your macros and know the right combination of proteins, carbs, and fat for your fat loss journey.

But before you get started with your macros, let me try to help you put a little more...

I want to explain one last thing so that you can have sustained weight loss for the rest of your life!

That should be worth your time!

METABOLIC CONFUSION

As I mentioned earlier, your body naturally adapts to change you make to maintain a balance.

This will unfortunately result in some "plateaus" along the way.

Many people today, especially women, have learned to low calorie diets for long periods of time in an effort to lose weight.

The usually works at first... but soon the yearly visits and the weight return coming off... or even worse, they begin to GAIN weight while eating the same amount of food.

When this happens, most begin to think their problem is with their genes, and they just weren't lucky enough to be born with good ones... They're armed with slow metabolism and there something they just have to live with... But that's the furthest thing from the truth!

So why does this happen so often?

In the past, we only shared these secrets through 1-on-1 coaching, starting at **$500-800 per month!**

But this proved to be out of the budget for a lot of people that we really wanted to help...

So eventually we compiled and recorded videos to share all the necessary keys you need in a 30-day video course.

It's called...

FLEXED

It has helped so many people from office workers to moms with several children, grandmas, bodybuilders, and just about any type of person you can think of. But don't just take our word for it, take a look below at some of our great...

TESTIMONIALS

Before I started working with Tyler I was eating only 1,000 calories a day but not gaining weight! I thought I was going to have to eat less or exercise more, but Tyler told me I needed to eat more to lose weight!

I was very nervous to eat more in fear that I would gain more weight than I already had. But Tyler was very encouraging & made small increases in my diet very well.

My weight didn't move much in the beginning, but after 3 months I got my calories up to 1,500 & started losing weight. After 11 months I lost 15 lbs. by eating more without any additional exercise.

Rachel

COURSE CURRICULUM

Our Flex Ed Macro Coaching Course is a great way to get started with flexible dieting!

- Get familiar with tracking foods and learning moderation with the flexible dieting lifestyle.
- Get coaching that is custom to you, your progress and you goals
- Get results without boring meal plans, the guesswork of cutting carbs/cryo/fats, or taking expensive pills and supplements.

Our Flexible Dieting certified coaches take you on a guided journey to reach your weight-loss goals.

MODULE 1
Get Started & Plan For Success

We'll show you who to start tracking your customized diet plan, You will learn about metabolism and what your body type needs to reach the goals you set for yourself. Learn to grocery shop and eat out successfully.

MODULE 2
Optimize Your Results

Learn proper structuring and timing of meals. Learn what supplements optimize results, and how to implement a cardio plan with how much and what types to optimize your results.

MODULE 3
Adjust Your Own Macros

Learn how to adjust your macros to maximize results. Learn how to maintain a binge, eating on the go, and most optimal pre & post workout meals.

MODULE 4
Advanced Dieting

Learn the in's and out's of reverse dieting. Gain the most muscle for the weight off. Learn how to add in High Intensity Fasting (IF) & Keto. Pave your path to the ultimate goal of intuitive eating.

All this, we charge $297 for this course. Because of it's insane value and the results that it was able to produce for so many people.

But because of our passion for helping people to get free from so many harmful fad diets, and to get rid of the poor self image that accompanies those harmful diets, we've continued to make it available to more and more people.

For a few days, we've decided to open this course up to almost everyone to give it a shot.

That's why we are offering a huge DISCOUNT to get started!

Ready to begin? Click the button below to immediately start to your Flexible Diet Life! Or create an account if you don't have one yet.

Fast, easy & secure!
